

Serial No. 10/602,248
Amendment dated December 12, 2006
First Office Action dated September 12, 2006

DEC 12 2006

AMENDMENTS TO THE SPECIFICATION

Please amend the Abstract of the Disclosure as follows:

~~The present invention is directed to an~~ An apparatus and method for efficiently calculating an intermediate value between a first end value such that the area and time required to implement this operation is minimized is described. ~~The present invention is also~~ The apparatus and method may be used to efficiently multiply a value by a fraction. A fraction is involved in calculating an intermediate value and also for multiplying by a fraction. When the denominator of the fraction is odd, the binary representation of the blending function, which is used to calculate an intermediate value, exhibits special characteristics. The special characteristics allow the present invention to, among others, avoid the use of multipliers, which require a large number of gates to implement. This invention exploits The method and apparatus described exploit this and other special characteristics in order to efficiently implement in hardware the blending function and to efficiently multiply a value by a fraction.
